

VIT[®]

Vellore Institute of Technology
(Deemed to be University under section 3 of UGC Act, 1956)

Course Code: CBS3005

**Course Title: Cloud, Microservices and
Applications**

Class Number: VL2025260105679

Lab Assessment - 2

Name: Atharva Khachane

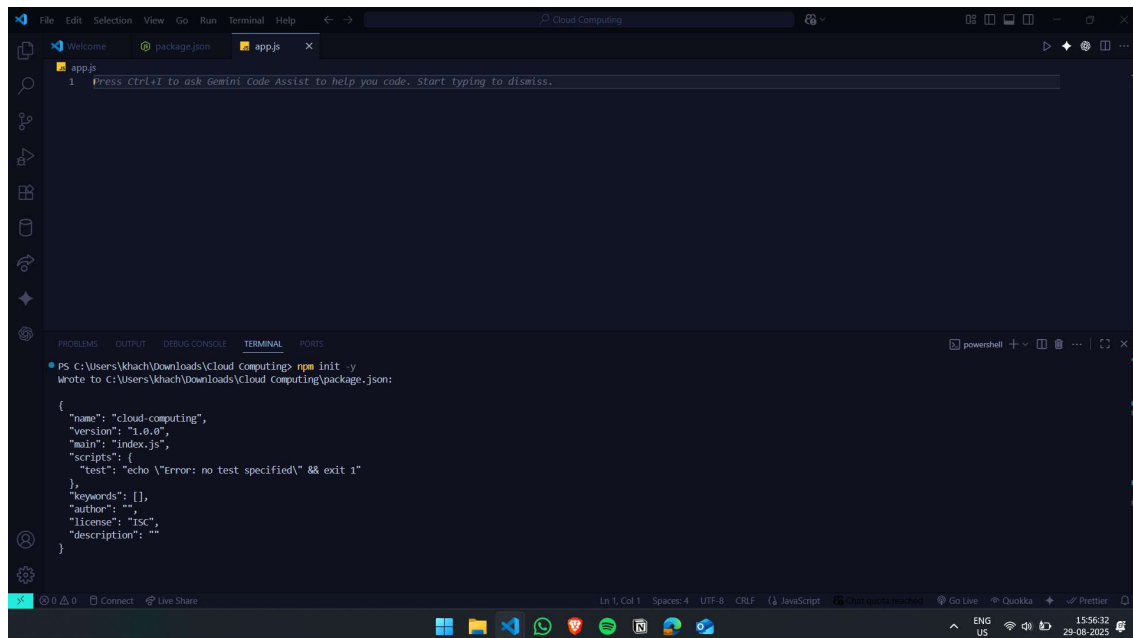

Reg No: 22BBS0155

Question:

Create a simple web application using your preferred programming language and framework (e.g., Node.js, Python, Java etc.). Ensure the application is fully functional and ready for deployment. Initialize an AWS Elastic Beanstalk environment for your application. Choose the appropriate platform (e.g., Node.js, Python, Java) and configure the environment settings. Package your web application and deploy it to the Elastic Beanstalk environment. Access the deployed web application via the Elastic Beanstalk URL provided. Test its functionality to confirm that the deployment was successful and that the application is accessible and performs as expected.

Node Application Creation:

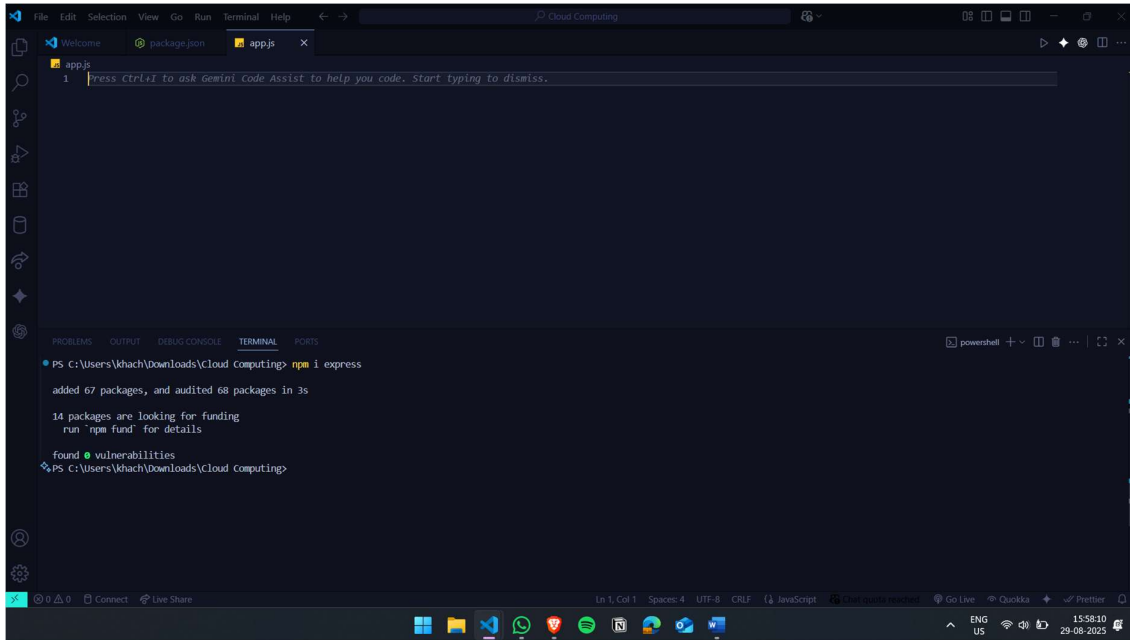

Initialize node application and download express

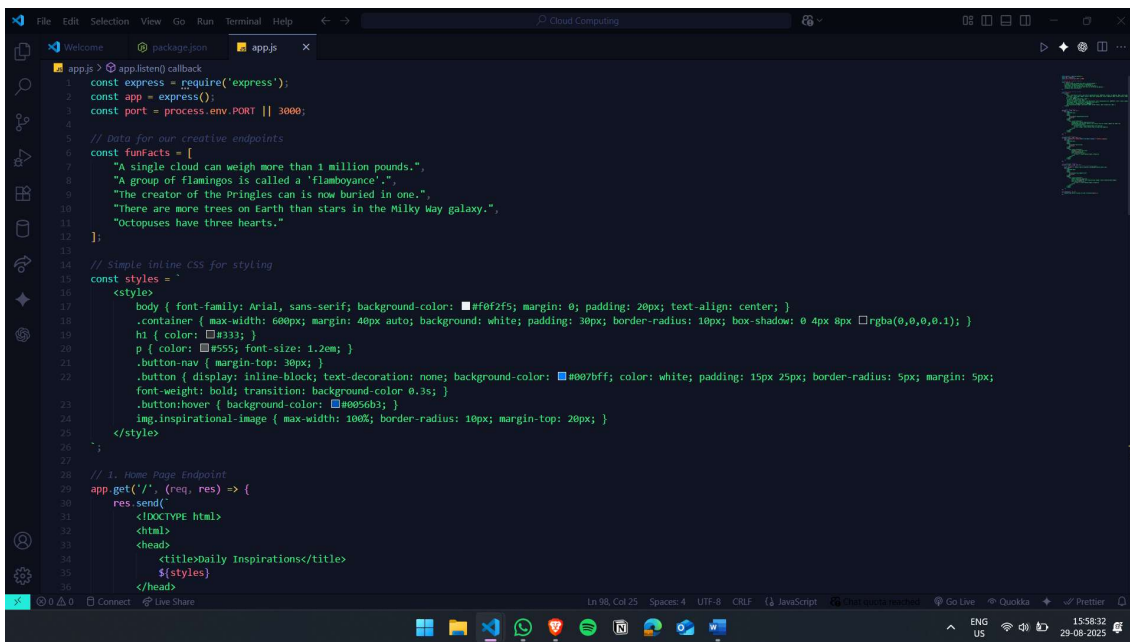

The screenshot shows the Visual Studio Code interface with a new project named 'cloud-computing' initialized. The file explorer on the left shows the project structure with 'package.json' and 'app.js'. The main editor area displays the 'app.js' file with a single line of code: `1 Press ctrl+I to ask Gemini Code Assist to help you code. Start typing to dismiss.`. The terminal at the bottom shows the command `npm init -y` being executed, which created the 'package.json' file. The terminal output shows the contents of 'package.json':

```
{
  "name": "cloud-computing",
  "version": "1.0.0",
  "main": "index.js",
  "scripts": {
    "test": "echo \"Error: no test specified\" && exit 1"
  },
  "keywords": [],
  "author": "",
  "license": "ISC",
  "description": ""
}
```

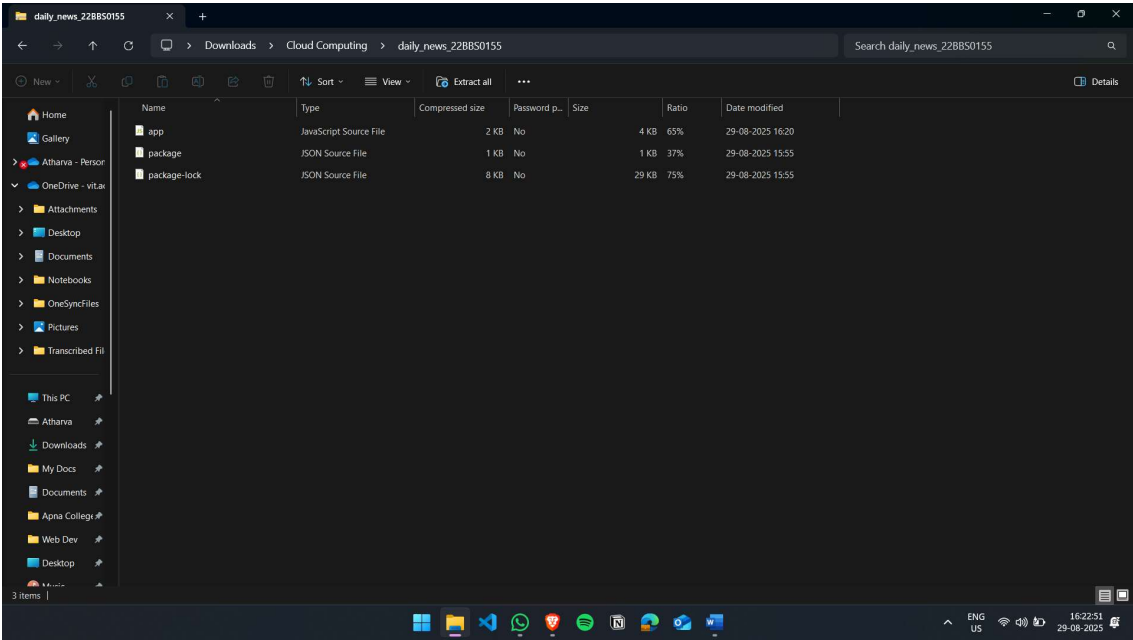

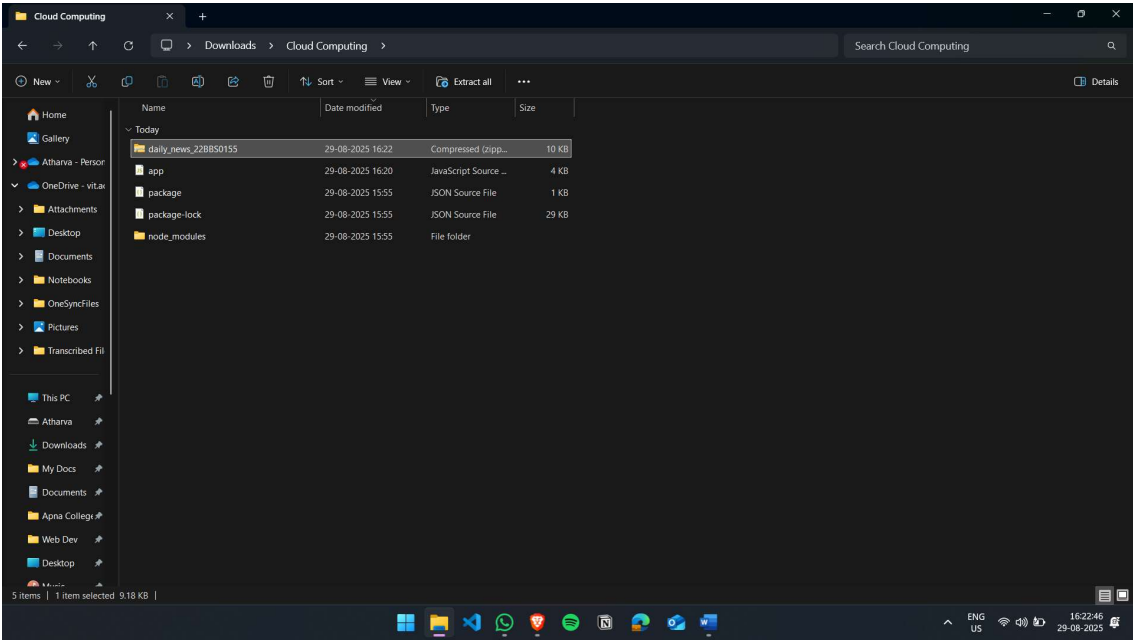

The status bar at the bottom indicates the file is 'app.js' in the 'cloud-computing' project, with a line number of 1 and column of 1. The system tray at the bottom right shows the date and time as 15:56:32 on 29-08-2025.

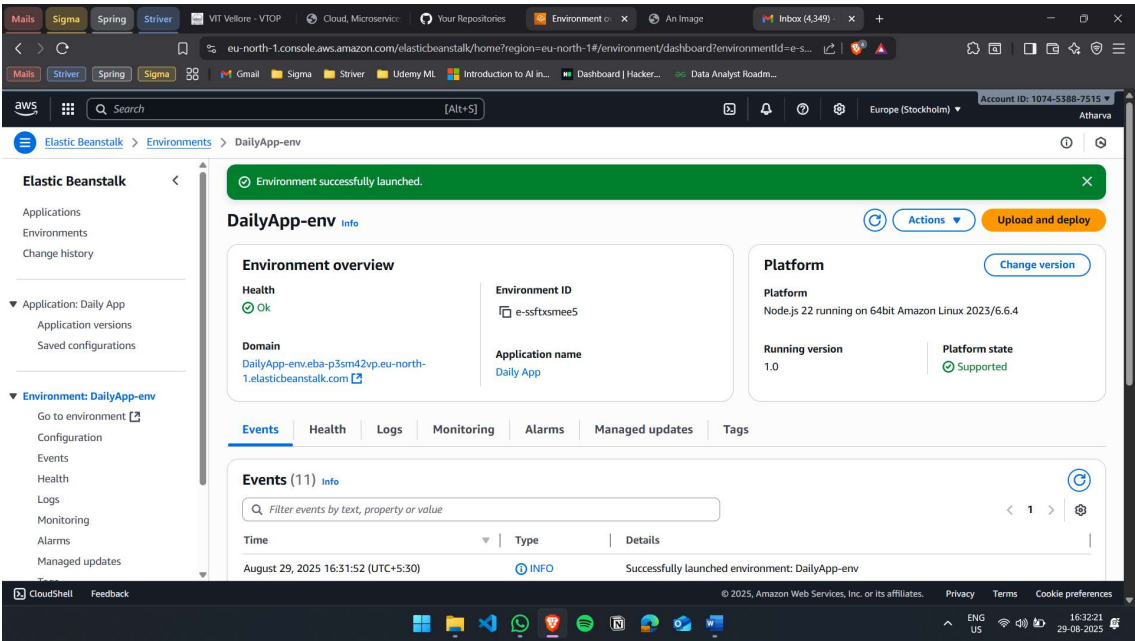

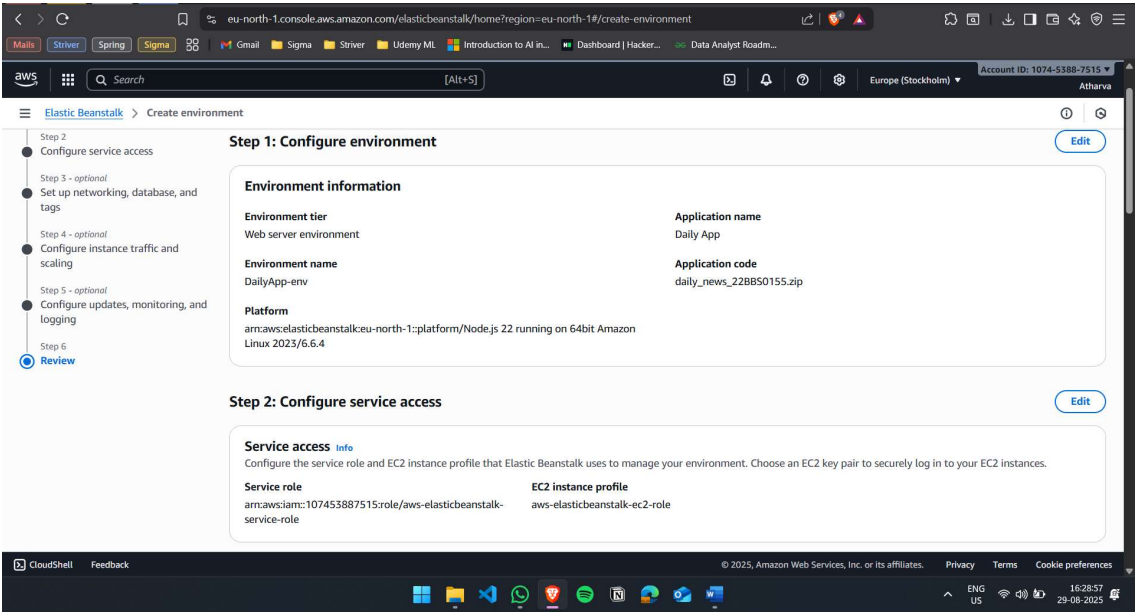

Create application.

Create a zip of the files app.js, package.json and package-lock.json

Create application on AWS Elastic Beanstalk

Access the application using the domain url
